

AWPS 'Elevator' Speech

- **The Army Workload & Performance System (AWPS) is a Suite of three software packages providing workload, resource, earned value and performance measurement reports that support Users, Managers and Leaders.**
- **AWPS provides a source of data to Army leadership in which all elements of Army business operations, requirements, budgets, human capital, resource allocation, and performance measurement are integrated.**
- **Two of the three packages, Automated Identification Technology (AIT) and the Field Mobile Solution (FMS) will improve mobile, RF data collection at a tactical level and reduce the amount of corrupted data being fed to the Standard Army Management Information Systems (STAMIS).**
- **The AIT/FMS solution will benefit users by speeding transactions with greater accuracy, eliminating paperwork, reducing the administrative workload, and feeding a real-time management dashboard of performance indicators.**
- **The third tool, the Army Workload and Performance System (AWPS), draws management data from STAMIS and incorporates it into Performance Measurement and Strategic Planning and Forecasting capabilities.**
- **AWPS contributes directly to reducing Army maintenance cycle time.**
- **Army Leadership will be able to make more responsive, better informed, accurate decisions thereby improving and transforming the Warfighter support needed to win on the Battlefield.**
- **AWPS has already proven itself in the field, resulting in an overall 60% reduction in the administrative/production control and supply process's cycle-time during its pilot.**
